Excellent, thank you. 50 ppm level explains DTSC's reaction to initial testing at 80 ppm.

Yes, it is the Eureka NV Smelter Site.

It is important to note that these clean up levels of 3000 ppm lead and 600 ppm arsenic are just for our 'worst first' approach – they are preliminary, given the scale of problem in Eureka. We would never use these numbers as final clean up numbers.

Our residential lead removal action level is 1200 ppm with a goal of 400 ppm. California uses 50 ppm lead. It also depends on what background is. Just for some context.

Thanks for comments/edits. Attached is a revised draft.

Dan – Is the city we’re referencing ‘Eureka, NV’?

Joel – I was not sure if you wanted me to add to the paper or just provide some language. I can do the former but in the recommendations section:

Region 9 can provide technical support on sampling plan design and risk communication.

A current Region 9 residential lead and arsenic clean up is addressing homes with levels exceeding 3000 ppm lead and 600 ppm arsenic. Some homes have levels that are 10 times higher and young children with blood lead levels exceeding 5 ug/dl.

Let me know if there is anything else I can do to help. Dan

Subject: Draft EXIDE summary

Please review the attached draft summary of state involvement w/Exide-Vernon facility. Let me know any changes/edit and I'll revise for Jared.
